

Just In Time Quick Check
Standard of Learning (SOL) 8.3b

Strand: Number and Number Sense

Standard of Learning (SOL) 8.3b

The student will determine both the positive and negative roots of a given perfect square.

Grade Level Skills:

- Determine the positive or negative square root of a given perfect square from 1 to 400.

Just in Time Quick Check

SOL 8.3b - Just in Time Quick Check

- 1) Determine if the following statements are true or false. Justify your reasoning for each statement.

Statement	True or False	Justification
$-\sqrt{9} = -81$		
$14 = -\sqrt{196}$		
$3 = \sqrt{6}$		
$-19 = -\sqrt{361}$		

- 2) Determine each square root.

a) $\sqrt{169}$

b) $-\sqrt{49}$

c) $\sqrt{289}$

d) $-\sqrt{225}$

- 3) Amy has a square bedroom. It has an area of 324 square feet. What is the length of each side of the room? Justify your answer.

SOL 8.3b - Just in Time Quick Check Teacher Notes

Common Errors/Misconceptions and their Possible Indications

- 1) Determine if the following statements are true or false. Justify your reasoning for each statement.

Statement	True or False	Justification
$-\sqrt{9} = -81$		
$14 = -\sqrt{196}$		
$3 = \sqrt{6}$		
$-19 = -\sqrt{361}$		

A common error students may make for the first statement is recognizing there is a perfect square relationship between 9 and 81 but and saying that statement is true. The radical would need to be over the 81 for the statement to be true. This indicates students may need more understanding of the radical symbol. Teachers may want to spend more practice with students breaking apart the value under the radical sign. For example: $\sqrt{49} = \sqrt{7(7)} = 7$.

A common error with the third statement is students dividing 6 by 2 to get 3 and saying the statement is true. This may indicate students need to explore square roots. Teachers may consider using area models to explore square roots. Refer to Grade 7 Curriculum Framework (see SOL 7.1d).

A common error for the second and fourth statements may be ignoring the negative before the radical. This may indicate students need more practice with negative square roots. Teachers may consider working backwards and look at where the perfect squares come from before finding the square roots. For example: $36 = 6(6) = 6^2$ and $36 = (-6)(-6) = (-6)^2$. Therefore both 6 and (-6) are square roots of 36 and the negative in front of the radical indicates that it is evaluating the negative square root.

- 2) Determine each square root.

a) $\sqrt{169}$

b) $-\sqrt{49}$

c) $\sqrt{289}$

d) $-\sqrt{225}$

A common error students may make is not taking the negative square roots for b and d . Refer to question 1 for indication.

A common error students may make is having the incorrect value for the square root. For example, a student may say a is 14 instead of 13. This may indicate students may need more practice exploring square roots. Teachers may consider using matching activities and area models to explore square roots.

- 3) Amy has a square bedroom. It has an area of 324 square feet. What is the length of each side of the room? Justify your answer.

A common error students may make is dividing 324 by 4 instead of taking the square root of 324. This may indicate students are thinking of perimeter instead of area and need more practice with the relationship between area of a square and the length of its sides. Teachers may consider using area models to explore the relationship between area of a square and the length of its sides.
